Proposal for Establishment of a PhD Program in Pharmaceutical Sciences

Within the College of Pharmacy

At the University of Hawaii, Hilo

October 27, 2010
Proposal for Establishment of a PhD Program in Pharmaceutical Sciences

Administrative Locus: College of Pharmacy, University of Hawaii at Hilo

Planning Committee: Robert P. Borris, Edward Fisher, Daniela Gündisch, Kenneth Morris, Karen Pellegrin, Anthony D. Wright (Chair)

Program Category: New (CoP-UHH)

Department/Program: College of Pharmacy

Degree Proposed: PhD in Pharmaceutical Sciences

Proposed Date of Implementation: August, 2011

Proposal for PhD Program in Pharmaceutical Sciences

Appendices

** Appendix A – Letters of support from Local Government, Industry, Academia 37
** Appendix B – Letters of interest from prospective PhD students 66
** Appendix C – Survey to assess demand for a PhD in Pharmaceutical Sciences 113
** Appendix D – Curriculum, Course Examples and Course Descriptions 116
** Appendix E – PhD Dissertation Topics 127
** Appendix F – Syllabi of courses available to support the PhD program 130
** Appendix G – Curriculum Vitae of Faculty 325
** Appendix G-1 – Curriculum Vitae of Dean, John M. Pezzuto 691
** Appendix H – Equipment in College 828
** Appendix I – Student Services 832
** Appendix J – Support Document from UHH Library 834
→ Appendix K – Financial Plan 841
** Appendix L – Program Assessment Survey 844
→ Appendix M – Approved ATP 848

** Appendices A – J and L are available on request

→ Attached appendices
1. Executive Summary - Background

Central to the success of the profession of pharmacy is the availability of well qualified academics in the pharmaceutical sciences who will continue to train and develop the generations of pharmacy educators and researchers that will follow them. Academically sound schools and colleges of pharmacy provide suitable courses at the professional and graduate levels to ensure an appropriate pipeline of scientists and practitioners who are well qualified to meet demand and make advances in a broad range of settings, including academic, industrial, governmental, clinical, retail, marketing, consultancy, to mention but a few.

The College of Pharmacy is now at the point in its development to start to fulfill its part of the obligation to provide the next generation of PhDs trained in the Pharmaceutical Sciences to ensure continued success of the profession locally, nationally and internationally. Indeed, development of this program forms an integral part of the College’s overall mission. Based on our present stage of development, we are confident we currently have the expertise, critical mass, and where-with-all for effective program implementation. We have also established that:

- The program has adequate resources available for success.
- There are no cross-program or departmental implications.
- The program reflects intellectual rigor and teaching excellence.
- Program coherence has been addressed.
- There is no impact on course and seat capacity.
- The program is consistent with the University Mission and Strategic Plan.
- The program will enhance the research output of faculty advising graduate students and so increase their ability to successful secure extramural funding.
- The program will result in the development of new industry and business opportunities in the State.
- The program is unique within the UH System.
- The program leverages unique internal competence and a unique environmental setting.
- Within the State and throughout the Pacific, only the College of Pharmacy at UHH has the expertise and resources needed to launch this program.

The Program discussed here will provide graduate training in the Pharmaceutical Sciences for students with a PharmD, MS or BS Degree, and those currently working in the field. Studies will culminate with the award of a PhD in Pharmaceutical Sciences, with an emphasis on natural products discovery and development and their importance in Pharmacy and healthcare in general. The program will utilize the extraordinary intellectual, biological, physical and cultural diversity on the Island of Hawaii, and within both the State and Asia-Pacific Region, as a focus of investigation and study. The program will prepare students for senior leadership positions in the Pharmaceutical Sciences in academia, research, education, government, industry and related fields - leaders who can identify, research, and problem solve issues related to the Pharmaceutical Sciences. The proposed PhD program will be designed to foster students’ development as critical thinkers, team players, self-directed interdisciplinary scholars and communicators, in the field of Pharmacy. The program will also provide enhanced research opportunities for PharmD and Post-Doctoral Fellows in the College of Pharmacy.

The graduate program will open many doors for our students and faculty alike. As already mentioned one of the primary duties of a university is to train the next generation of scientists and teachers; graduate students and postdoctoral fellows who will be pursuing research in the College under the supervision and mentoring of the academic CoP faculty. Addition of these future professionals to the System will greatly enhance the intellectual depth and breadth of the College and Campus community through seminar programs, discussion groups and campus lectures. The diverse scientific perspectives brought to the College, not just by the faculty but also by graduate students and postdoctoral fellows from a variety of backgrounds, will all contribute to the advancement of scholarship, which in turn will lead to an increase in the exposure of our programs to the scientific and industrial community and potential sources of funding. As the program develops, the University of Hawaii will increasingly be recognized as the center of excellence in pharmaceutical research, discovery, development and education in the Pacific Basin.
Proposal for PhD Program in Pharmaceutical Sciences 10/27/2010

The benefits to our professional students cannot be overemphasized. A graduate program exposes students to career opportunities beyond the practice of pharmacy and creates new opportunities to enter into the pharmaceutical industry and academia. An active graduate program will give the professional student the opportunity to enter for career options including drug discovery, pharmaceutics, medicinal chemistry, pharmacology, or clinical research before committing to a particular career path.

The PharmD degree prepares graduates to be clinicians, delivering healthcare, while the PhD trains research scientists. The PhD in Pharmaceutical Sciences complements the PharmD degree by preparing graduates to be scientists with extensive skills in research design, techniques and methodologies. Analysis of available faculty data nationwide reveals the demand for faculty members continues to grow as new pharmacy schools open and current schools expand their professional programs to address pharmacy workforce issues. It was estimated by an AACP (American Association of Colleges of Pharmacy) task force in 2006-2007 [1] that over the following 10 years, faculty demand will increase by about 20% as approximately 422 faculty will retire and 400 new positions will be created due to program expansion. Unfortunately, this level of growth occurs in the face of a current vacancy rate of 10% (427 positions are currently open). Three-fourths of the schools and colleges surveyed reported vacant or lost faculty positions in 2005-06. The ability to attract new faculty continues to be problematic, meaning there will always be places for PhD graduates. It is not only academia that will require PhD graduates but also government and industry [2]. These findings auger well for the future of the profession of Pharmacy and for graduates of the proposed PhD Program especially when ones realizes the number of positions available to new graduates is greater than their actual number [2, 3]. The demographics of age and disease state in the nation generate significant pressure on all aspects of health care. This dictates the need for scientists to discover and develop new drugs for the public. This has particular relevance to the ever increasing expansion of the Asian market [4].

All of the top American universities that have a College of Pharmacy offer a PhD in the Pharmaceutical Sciences [3, 5] graduating a total of around 450 students annually according to American Association of Colleges of Pharmacy Surveys [3]. In fact, there is evidence that top pharmacy programs have a distinct competitive advantage through research excellence and this advantage is likely to enhance program stability and sustainability relative to programs that do not have this research capacity [5].

As well as serving to ensure stability and continued success of the College and provide its graduates and other residents an opportunity to obtain a PhD in the Pharmaceutical Sciences without having to leave the State, this program will also facilitate the spawning of a culture of Pharmaceutical based research here in Hawaii that is entirely in support of President Greenwood’s vision for the UH system. President Greenwood states [6], "As the sole public institution of higher education, the University of Hawaii plays a key role in building Hawaii’s educational and economic future", and this will be achieved by us, "Increasing the number of college graduates by 25 percent by 2015, contributing through research, innovation and technology transfer, and ensuring our campuses and facilities reflect our mission as a 21st-century university built on excellence." The significance and importance of having this nucleus of research and development expertise present within the University and the State is already being recognized by community leaders, local entrepreneurs, and academics within the UH system alike (see letters of support Appendix A). The importance of the PhD program to the establishment and growth of a research, development and technology transfer culture within the College of Pharmacy cannot be overstated. Already, the College’s faculty are actively engaged in their research programs and to ensure their continued success and the next tier of education and training needs to be added to the College’s program, the PhD in Pharmaceutical Sciences. With its introduction the College and hence the UH system and the State as a whole will be poised to help deliver on significant parts of the University systems stated goals, as articulated by President Greenwood, for the 21st Century [6].

As the PhD enhanced culture of research, development and technology transfer in the Pharmaceutical Sciences expands and it becomes more widely known that it exists here within the UH System, further opportunities for extramural funding, collaboration, and growth will follow. Hawaii, and the UH System in particular, is ideally positioned to become part of the future anticipated growth in the western use of Indian and Chinese Traditional Medicines [7-9], growth in the Asian pharmaceutical market place [4], as well as to contribute to the next stage of development of young industries already taking root within the State (see Appendix A, letters of support).
In conclusion, the main advantages of establishing the PhD in the Pharmaceutical Sciences within the College of Pharmacy at the University of Hawaii at Hilo are; to provide opportunities for residents of the State of Hawaii that currently do not exist and to ensure an adequate supply of scientists for future jobs; creation of a program that can make a unique contribution to the seven billion dollar healthcare related economic activity within the State [10]; promotion of new research, development and technology transfer in an area that is critically lacking within the State; and, establishment of an important legacy for generations to come.
2. Program Objectives

This program will provide graduate training in the Pharmaceutical Sciences for students with a PharmD, MS or Baccalaureate Degree, and those currently working in the field. Studies will culminate with the award of a PhD in Pharmaceutical Sciences, with an emphasis on natural products and their importance in Pharmacy. The program will utilize the extraordinary intellectual, biological, physical and cultural diversity on the Island of Hawaii, and within both the State and Asia-Pacific Region, as a focus of investigation and study. The program will prepare students for senior leadership positions in the Pharmaceutical Sciences in academia, research, education, government, industry and any related fields - leaders who can identify, research, and problem solve issues related to the Pharmaceutical Sciences. The proposed PhD program will also be designed to foster students' development as critical thinkers, team players, self-directed interdisciplinary scholars and communicators, in the field of Pharmacy. The program will also provide enhanced research opportunities for PharmD and post-doctoral students in the College of Pharmacy. Aside from the objectives directly aimed at the students in the program, the program also aims to capitalize on the wealth of knowledge and experience of the faculty and in so doing potentiate their knowledge and skills to ensure the College is seen as a center of excellence in Pharmaceutical based research. The key goal of this latter objective is to develop capacity that will attract investors and to be a leader in technology transfer success within the UH System.

Specific objectives:

• To provide a meaningful and important course of study available nowhere else within the State of Hawaii and to some extent nowhere else within the Country.
• To ensure places exist within the program to train as many local students as is practicable.
• To enhance academic rigor and scholarship within the CoP and the UH Hilo in general.
• To leverage the research expertise of CoP faculty.
• To develop a community research partnership, process, and protocol for understanding the diversity of natural products originating in Hawaii, the Pacific, and around the world and their applications to healing in a culturally respectful way.
• To advance the science of Pharmacy and Pharmaceutical Sciences on the international stage.
• To create a pharmaceutical technology research center for dosage form design and characterization based on the precepts of Quality by Design.
• To foster knowledge of and help direct current trends and issues in Pharmaceutical Sciences including basic and applied research and natural resource issues.
• To provide participants with specific experiences in conceptual and technical research areas in the Pharmaceutical Sciences, e.g., Pharmaceutics, Pharmacognosy, Medicinal Chemistry, Pharmacology, as well as in exploring the natural environment, marine and terrestrial, for potentially economical important natural products.
• To promote research and scholarly activities that will enable participants to successfully develop a resume suited to successfully pursue a career in the pharmaceutical and related industries.
• To offer new career training options to undergraduate and pharmacy students within the UH System, Statewide and throughout the Asia-Pacific Basin.
• To develop methods and/or innovations in analytical processes and technologies relevant to natural product research and discovery and drug safety.
• Develop a center of biotechnological expertise that will foster new business development within the State.
• Create opportunities for businesses to locate in Hawaii that have traditionally been mainland based.
• Create a culture of excellence in research, development and translational science.
• Provide opportunities for residents of the State of Hawaii that currently do not exist.
• Ensure the College's potential to become the driving force for new industrial and business investment is realized by the creation of direct links with potential industrial and business partners.
• Establish from its inception the culture of excellence at all levels within the program is maintained at benchmark levels of other UH PhD programs.
• To support President Greenwood's vision for building Hawaii's educational and economic future as outlined in her document available at http://www.hawaii.edu/offices/op/2010/initiatives-brochure.pdf, entitled, "The University of Hawaii for the 21st Century".
To accomplish these objectives the program will ensure that Graduate Students within the program will:

- Complete the seven stages for a successful PhD in any technical discipline: Research cannot be "taught", however there are certain guiding elements that must be included in the graduate experience so candidates may discover what is entailed in becoming an independent researcher.
  1. Identify a problem/question
  2. Form an hypothesis
  3. Develop a model
  4. Design an experimental strategy to test the hypothesis
  5. Execute experimental plan
  6. Interpret the data against the hypothesis
  7. Report the results in a dissertation and peer reviewed publications
- Develop state of the art skills in the Pharmaceutical Sciences.
- Perform scientific research that will advance knowledge in the interdisciplinary field of Pharmaceutical Sciences.
- Be educated and trained to use advanced technological equipment in order to perform quantitative analysis and be able to interpret complex data.
- Learn how to apply research findings.
- Present research findings at local, national and international forums.
- Learn how to prepare scientific publications and proposals.
- Interpret and critique professional scientific literature.
- Undertake an original individual research project leading to a PhD Dissertation.
- Develop an understanding of the importance of the concept of translation research.
- Be able to identify what aspects of their individual program may be usefully transferred to some applied research program.
- Pass qualifying exams by the end of their third academic year.
- Write and successfully defend their Dissertation.
- Learn the importance of basic and applied research for underpinning future growth and development of Pharmaceutical related industries and business in Hawaii.

From the faculty standpoint, program objectives will be accomplished, further extended and developed through the collective expertise of those individuals involved directly with delivering the courses and guiding the research within the College of Pharmacy (CoP). The faculty will be assisted by a graduate program director and will be responsible for maintaining the quality of admission requirements, curricular and program requirements, candidacy, comprehensive exams, and dissertation research that is original, independent, and a significant contribution to the field. It is also anticipated that these same faulty will be the ones who will ensure that their own didactic and research programs, and hence the program in general, becomes so competitive that the College as a whole will become recognized as a leader in selected areas of pharmaceutical research and development.

3. Relationship of the Program to BOR criteria

The relationship of the PhD Program to the seven BOR criteria for establishment of new programs are given in the form of references to specific sections and references within the planning document below each criterion:

1. The direct relevance of the contribution of the field of study to the professional, economic, social, occupational and general educational needs of Hawai‘i.

   This is a totally unique program that fills an important niche in the State of Hawaii. The specific ways in which the program contributes to the professional, economic, social, occupational and general educational needs of Hawai‘i are described in Sections 2, 6 and 7 as well as in letters of support and interest (Appendices A and B).

2. A "national needs factor" that emphasizes the direct relevance of the contributions of the field of study

   (continue)
Proposal for PhD Program in Pharmaceutical Sciences

10/27/2010

to national needs and where Hawai‘i and the University have unique or outstanding resources to respond with quality.

The UH Hilo College of Pharmacy was started in 2006 and now represents a powerhouse of expertise in pharmaceutical science. Together with state-of-the-art equipment and the natural resources of the Big Island, the State of Hawai‘i and the Pacific as a whole, there is no better place to start this new program. Additional details are presented in 2, 6 and 7 as well as in letters of support and interest (Appendices A and B).

3. An "international needs factor" that emphasizes the direct relevance of the contributions of the field of study to international needs and where Hawai‘i and the University have unique or outstanding resources to respond with quality.

Pharmaceutical Science is an international discipline that will meet unique needs throughout Asia, the Pacific Region, and the rest of the world. The UH Hilo College of Pharmacy is well positioned to become one of the top programs of its type in the world. Further details are given in Sections 2, 6 and 7 as well as in letters of support and interest (Appendices A and B).

4. An educational needs factor that indicates the direct relevance of a field of study to basic educational needs for which there is a demand by Hawai‘i’s population.

This will be the first and only program of this type in Hawai‘i. We have established a need for the program and there is demand in Hawai‘i as described in Sections 2, 6, and 7 as well as in the letters of support and interest (Appendices A and B).

5. The relevance of a field of study as a necessary supporting discipline for quality programs identified by the above criteria.

The PhD program in Pharmaceutical Sciences is critical for the success of the development of the College of Pharmacy. All high quality colleges of pharmacy have graduate programs that complement the professional program. We are ready to launch the program now. Further details are presented in Sections 2, 6, and 7 as well as in letters of support and interest (Appendices A and B).

6. A qualitative assessment of the program in relation to competing demands for resources by new programs and continuing programs. Such assessment will include among other information, program reviews, student performance and placement, accreditation reports, and faculty resources.

This is a new program that has been in planning since the creation of the College of Pharmacy. There are no competing demands and the program will enhance existing activities. All necessary resources are available. Firm plans are in place for assessment. A more detailed description is given in Sections 8, 9, 10, and 11.

7. An assessment of productivity and cost/benefit considerations within the overall context of campus and University "mission" and planning priorities.

The College of Pharmacy was founded based on the premise of striving for excellence, and thereby it was anticipated the PhD in Pharmaceutical Sciences would be introduced at the appropriate time. As a result, the cost/benefit ratio is very favorable and implementation of the program will increase productivity. Fostering development of the College of Pharmacy is a high priority that conforms perfectly with the UH mission and all strategic plans. More information is provided in Section 10.

4. Relationship to Other Programs

It is expected that the PhD Program in Pharmaceutical Sciences will both assist with retention of students within the UH System by providing them with an option for post graduate studies here within the State and make UH an even more attractive option for study for those students who in the past would not have considered coming to Hawaii or staying in Hawaii for their continued education.
It is anticipated that for the first year or two the Program will be "stand alone" within the College of Pharmacy and as such will have no direct relationship to or impact on other programs within UH System. In the medium to long term, however, other programs may contribute to and benefit from this Program's development. Indeed, it is hoped that the UH System as a whole will benefit greatly from having a PhD program in the Pharmaceutical Sciences. Logical contributors in the future would be from any of the scientific disciplines on the UHH campus and also possibly from JABSOM and CRCH. As stated by Dr. Vogel in his letter of support: "A PhD program in Pharmaceutical Sciences will not only provide additional PhD-level opportunities for students from Guam but would also strengthen the overall breadth and depth of cancer research at UH as well as our long-term partnership with the University of Guam." As the program grows and becomes firmly established, other such collaborations and relationships are anticipated to develop over time.
5. Comparison with Similar Programs at Comparable Institutions

The PhD Program in the Pharmaceutical Sciences at the College of Pharmacy, UH Hilo will focus on the four main areas that come under the heading of the Pharmaceutical Sciences with an emphasis on Hawaii as a natural laboratory and natural products and a scientific natural resources in general. The main topic areas will be:

- Medicinal Chemistry
- Pharmaceutics
- Pharmacology
- Pharmacognosy

The Core subjects of the program will be completed in year one followed by a minimum of another three years of electives and research that will be grounded in the four main topic areas listed above. The elective and research offerings will enable all candidates to gain not only an overall graduate education in the Pharmaceutical Sciences generally but also to focus on an area of specialization. A potential typical course is outlined below and compared to some from other Colleges around the Country. In the following Table, credit hours are given in parentheses, e.g., (3).

\(^1\)Students are required to take a minimum of 96 credit hours, at least 40 of which are recommended to be in didactic course work.

\(^2\)Students are required to take a minimum of 60 credit hours, at least 36 of which must be in didactic course work.

\(^3\)From this course it is not exactly clear the number of hours required for the PhD program alone but it is roughly comparable to the ones proposed for the other programs listed, an abstraction suggests a minimum of 97, at least 49 of which must be in didactic course work.

\(^4\)Students are required to take a minimum of 96 credit hours, at least 26 of which must be in didactic course work.

\(^5\)Students are required to take a minimum of 67 credit hours, at least 40 of which must be major course work, 9 units of minor coursework, and 18 units of dissertation.
6. Program Justification

The creation of a graduate program offering the PhD degree is the next logical step in the academic development of the UH Hilo CoP. Every high ranking and well respected College of Pharmacy in the US has a PhD program [3, 5]. Indeed, any ranking program in any academic field has the PhD as a benchmark for excellence. Currently, the PhD degree in Pharmaceutical Sciences is the recognized entry level degree necessary to assure that graduates are competitive in the current job market for scientists able to develop, lead, and direct independent research in industrial, academic, educational and government settings, locally, nationally and internationally. Indeed, it is an essential step toward fulfilling the mission of the CoP, which is to educate pharmacy practitioners and leaders, to serve as a catalyst for much needed innovations and discoveries in pharmaceutical sciences and practice for promoting health and well-being, and to deliver quality patient care, as it solidifies our intentions of enhancing the research capabilities of UH Hilo [11]. Only through an active graduate program will the CoP and its faculty be able to fulfill their obligations to expand the essential knowledge base of the local, national and global medical community and produce highly skilled researchers, practitioners, and teachers who continue the advance of biomedical science. It should also be noted that in current nationwide PharmD programs, pharmacists are no longer being trained to be researchers in the Pharmaceutical Sciences [2]. This indicates there is already a projected need for the people who will graduate from this program.

A graduate program in the CoP will open many doors for our students and faculty. One of the primary duties of a university is to train the next generation of scientists and teachers; graduate students and postdoctoral fellows [2] who will be pursuing research in the College under the supervision and mentoring of the academic faculty. Addition of these future professionals to the System will greatly enhance the intellectual depth and breadth of the College and Campus community through seminar programs, discussion groups and campus lectures. The diverse scientific perspectives brought to the College, not just by the faculty but also by graduate students and postdoctoral fellows from a variety of backgrounds, will all contribute to the advancement of scholarship, which in turn will lead to an increase in the exposure of our programs to the scientific community and potential sources of funding. As the program develops, the University of Hawaii will increasingly be recognized as the center of excellence in pharmaceutical research and education in the Pacific Basin and become an attractive option for investment once it is realized that there is a vibrant research culture in this area that is producing world class scientists and results that can be translated in products that are locally derived. Without the PhD program, advances of this type cannot be made and new investment and development will not be attracted to the State.

The benefits to our professional students cannot be overemphasized. A graduate program exposes students to career opportunities in addition to the practice of pharmacy and creates additional opportunities to enter into the pharmaceutical industry and academia. An active graduate program will give the professional student the opportunity to enter into potential career options like drug discovery, pharmaceutics, medicinal chemistry, pharmacology, or clinical research before committing to a particular career path. Professional students will closely interact with graduate students and postdoctoral fellows who have already decided to pursue one of these fields, and they will receive the guidance and mentoring of a faculty member working at the forefront of their particular field. Students completing their PharmD program in the UH Hilo CoP will gain an understanding and appreciation of the real breadth of opportunities through which pharmacists can contribute to modern healthcare.

Considerable research funding from the NIH, NCI, NSF and similar agencies is focused on drugs, from their discovery to ensuring that they are beneficial to human health [12]. The enhanced depth and quality of students offered by a PhD program in the Pharmaceutical Sciences would greatly assist UHH researchers in competing for these funds and assist them with becoming involved in more translational and developmental areas of research. The proposed PhD will also provide an interdisciplinary, team-approach philosophy to problem solving needed by professionals today, by providing collaborations among students and faculty from all of the disciplines that are encompassed by the Pharmaceutical Sciences. Such diversity in student interactions can create a dynamic intellectual environment and improve the quality of research, research ideas, and information generated from such a program.

This program will be unique in the Pacific Islands. Our location in Hilo will serve to make the program accessible to students from Hawaii, as well as those from other nations in the Pacific, who are considered under-represented minorities in the scientific community. It is expected that the research and scholarly
activities of this program will help to spawn a local pharmaceutical/biotechnology industry in Hawaii, as similar programs have done in numerous other locations around the country, thereby creating a vibrant job market for our students upon graduation, while bolstering employment and the economy.

Since a PhD in the Pharmaceutical Sciences has never been offered within the University of Hawaii System, residents of Hawaii, current pharmacy students and those undertaking BS and MS degrees in Hawaii and the Asia-Pacific region, and prospective mainland students, have not had the opportunity to obtain advanced training in the Pharmaceutical Sciences within the State. These prospective students have no choice but to leave or not return to the State to continue their studies. Since there are very few PhD programs of this type in the Asia-Pacific Region, foreign students from the Asia-Pacific region must also go somewhere other than Hawaii for training in this scientific area. All of the top American universities that have a College of Pharmacy offer a PhD in the Pharmaceutical Sciences. According to American Association of Colleges of Pharmacy (AACP) Surveys [3], 450 students graduate annually from these programs. Hawaii is losing students to these mainland schools and in so doing is losing a significant investment already made in such individuals, their intellectual capacity to help the State develop centers of tertiary industry/business, the ability to potentiate the intellectual capacity of its faculty, and the chance to develop programs that will lead to extramural funding and translational research. We propose to fill this academic gap within the UH System and better serve the needs of the people of Hawaii and the Asia-Pacific region by providing a PhD program that can address the unique characteristics of our region, serve as a center of excellence to promote opportunities for citizens and economic development for the State, create highly marketable students who will be eagerly sought after by future employers, and anyone who is considering investing in the State and probably quite some who are as yet unaware of the potential of this State as a natural products Mecca.

Once the PhD program in Pharmaceutical Sciences is initiated there will be significant interest from local, national and international students who will want to participate in such a unique program in a truly unique location that offers such unique opportunities. Currently, over 20 external students have expressed interest in applying to join our program to pursue a PhD even before we entered the approval to plan stage. Once the program commences it is anticipated that we will have an initial cohort of 5 and 10 students per year leading to a total of 25-30 graduate students in the College, as a whole, within 5 years.

7. Needs Assessment

According to data available from AACP [3], as of Fall 2009, there were 5349 full time and 553 part time faculty in the 114 Colleges and Schools of Pharmacy across the US. Of these colleges and schools, 66, including all high ranking colleges and schools, offer postgraduate programs. Data from Surveys of Earned Doctorates (SED) sponsored by NSF, NIH, DOE, NEH and NASA [13] indicate that the top colleges and schools award around 160 doctoral degrees in Pharmacy annually, while overall the actual number is around 450 [3]. Analysis of available faculty data nationwide revealed the demand for faculty members continues to grow as new pharmacy schools open and current schools expand their professional programs to address pharmacy workforce issues. It was estimated by an AACP task force in 2006-2007 [1] that over the following 10 years, faculty demand will increase by about 20% as approximately 422 faculty will retire and 400 new positions will be created due to program expansion. Unfortunately, this level of growth occurs in the face of a current vacancy rate of 10% (427 positions are currently open). Three-fourths of the schools and colleges surveyed reported vacant or lost faculty positions in 2005-06. The ability to attract new faculty continues to be problematic, meaning there will always be places for PhD graduates. It is not only academia that will require PhD graduates but also government and industry.

If one assumes a turn over of around 5% per year within all systems where graduates of this program might be likely to find employment, through career changes, retirement, and death it can be seen that the number of PhD graduates currently entering the workforce is inadequate to fulfill the projected need. So, these numbers not only attest to the demand/need for training in this discipline and an academic gap in graduate program offerings in the UH System, but also show that the number of Phd graduates is not satisfying the demand of the US generally and certainly not for any developments in Hawaii. Currently, 100% of the UHH CoP Department of Pharmaceutical Sciences faculty were trained outside the State and 100% had no relation to the State before moving here. All leading US universities, including many on the west coast such as Oregon State, University of Washington, UC Davis, UC Berkeley, as well as Colorado State, and
Utah State, compete with Hawaii for students. Indeed, most major land-grant universities across the nation offer a doctoral degree in the Pharmaceutical Sciences: University of Michigan, University of California San Francisco, University of Texas, University of Kentucky, University of Michigan, Purdue University, University of Minnesota, Ohio State University, University of Arizona, University of Florida, University of Maryland Baltimore, University of North Carolina Chapel Hill, University of Tennessee, University of Illinois Chicago, University of Washington, University of Utah, University of Wisconsin, University of Southern California, and University of Iowa to name a few. As we are a new College we cannot say at this stage where our students will go if they want to pursue a PhD, but it is clear that if we do not offer such a program here they will not be staying in Hawaii to assist with the growth and development of pharmaceutical science related ventures so the State will not just be losing students but also their intellectual and creative capacities. Without establishment of this program, students who chose to remain in Hawaii for family reasons will not have the opportunity to enroll in such a program in their State. At this stage it is reasonable to assume that the demand for a PhD program in the Pharmaceutical Sciences in Hawaii could easily result in the acceptance of 2-4 high-quality students per year.

For letters of interest from students for the establishment of the program here in the CoP at UHH see Appendix B. As can be seen from these letters, interest in developing this program is considerable from people who are most likely to be the ones who will be its first participants.

State wide and Local Need for a PhD Pharmaceutical Sciences

If, as indicated by the President of the UH System, Dr. M.R.C. Greenwood [6], UH is to contribute to Hawaii’s overall economic future through research, innovation and technology transfer, and also to enhance our ability to compete for extramural funding and pursue activities and discoveries that benefit the community, it has to do everything it can to show industry and business at all levels and in as many areas as is practicable that it is up to the task. The proposed program is an ideal vehicle given the current and project dramatic need for pharmaceutical based health care, the demographics of the State and National population and the unique environ of the Big Island.

Currently, the College of Pharmacy generates nearly $10 million in tuition revenue for the University, and over $1 million in donations [14]. Added to this, the College’s activities are projected to have an economic impact of over $50 million per year throughout the State [15]. On the basis of its current and projected success and economic value to the State, the College should be encouraged to realize its full potential by completing its original mission of offering the full range of academic programs currently being offered by all of the well ranked Colleges of Pharmacy across the US. In so doing become well positioned to compete for the extramural and industrial funding mentioned by Dr. Greenwood [6]. This means offering a PhD program to well qualified applicants. Establishment of this program will not only serve as a bastion of academic learning and discovery but will also provide the foundations for the development of a pharmaceutical industry within the State and facilitate much needed translation research.

Currently, in the State of Hawaii, trained individuals in almost all of the areas of employment to be discussed under this heading, if they are from Hawaii, will have had to leave the State to be trained in colleges of pharmacy on the Mainland US or elsewhere.

A graduate program in the CoP will help resolve many of the issues associated with having to leave the State for education purposes and open many doors for our students and faculty alike as it will provide them opportunities that were previously not available within the State. This in itself is probably the single most important driving force for this program. Added to this the fact that pharmacists are no longer being trained to be researchers in the Pharmaceutical Sciences where there is a general shortage in many areas of research, quality control, production, development, marketing, administration and sales means that there is already a projected need for the people who will graduate from this program.

To assess if this perceived need was genuine a survey of the current students enrolled in the UHH CoP was undertaken. The results of this survey (See Appendix C) showed that from our current four classes, 2011 (8), 2012 (11), 2013 (38) and 2014 (42) a total of 99 students would be interested in participating in this program when it becomes available. This survey was then extended to include a limited number of other potentially interested applicants locally, nationally and internationally. The results of this survey showed that there was interest from 42 local, two (2) national, and eight (8) international individuals [16].
Proposal for PhD Program in Pharmaceutical Sciences

With need established at the student level the next step was to establish need for these individuals once they have graduated. In general almost all of the graduates from a program like this one will go on to Post Doctoral studies, i.e., residency, MBA and the like, either within the State, nationally or internationally so as to expand their options and broaden their skills. Others may go directly into industry or government but the majority will probably undertake Post Doctoral studies.

The need for Post Doctoral Fellows trained in the Pharmaceutical Sciences locally and nationally is expanding, with many of these positions currently being occupied by international applicants. In any one year nationally there are literally hundreds of Post Doctoral and related positions available in areas directly related to the PhD degree the candidates from this program will have obtained.

Once an individual has completed a term as a Post Doctoral Fellow there are a variety of career paths that may be undertaken. The two most obvious paths are into academia or industry. According to an AACP report [Report of the 2006/2007, COF (Council of Faculty)/COD (Council of Deans) Task Force on, Faculty Workforce, June 15, 2007] it was estimated that the demand for Academic Pharmacy Faculty will increase by about 20% over the next few years as 422 faculty retire and up to 400 new vacancies will be created. The rate of retirement will remain fairly constant for the foreseeable future as about 30% of all faculty are over 50 years of age. At the time of this AACP report there were 427 positions still vacant. Of all of these positions about 40% will be in the Pharmaceutical Sciences, meaning that in this area alone some hundreds of PhD or equivalently qualified individuals will required each year for the foreseeable future. Of course colleges and universities beyond pharmacy greatly expand these opportunities. Graduates of the program would be well positioned for employment in departments of Pharmacology, for example.

In the industrial pharmacy sector, even though there has been rationalizations and some contractions over the past ten years or so, there will always be a demand for well qualified and trained PhD graduates simply because of attrition (e.g. retirement), and the like, and the fact that this industry will again have to expand if it is to raise to the challenge of providing new drugs to deal with current and emerging health care issues. According to the US Department of Labor, Bureau of Labor Statistics, Occupational Outlook Quarterly [17] Nationwide between 2008 and 2018 there will be an average growth of employment opportunities of at least 3% in all industries related to the production of pharmaceuticals. In their Career Guide to Industries, 2010-11 Edition [18], Pharmaceutical and Medicine Manufacturing section it was pointed out that this industry alone in 2008 employed 289,800 wage and salary earners. About 87% of these jobs were in establishments that employed more than 100 workers. They go on to state that, "The number of wage and salary jobs in pharmaceutical and medicine manufacturing is expected to increase by 6 percent over the 2008-18 period, compared with 11% projected for all industries combined. Even during fluctuating economic conditions, demand is expected to remain strong for this industry's products." Under job prospects the report states, "Prospects should be favorable, particularly for life scientists with a doctoral degree. Unlike many other manufacturing industries, the pharmaceutical and medicine manufacturing industry is not highly sensitive to changes in economic conditions. Even during periods of high unemployment, work is likely to be relatively stable in this industry, because consumption of medicine does not vary greatly with economic conditions. Additional openings will arise from the need to replace workers who transfer to other industries, retire, or leave the workforce for other reasons." Even at this level it is not difficult to calculate that the anticipated percentage growth will translate into hundreds of opportunities for new graduates. Further support for this comes from the article by Hartzema and Perfetto, in the journal Pharmaceutical Research [19] where they show that even though the supply of pharmaceutical scientists has increased, the increases have been outpaced by increases in demand. More recently Augsburger in his article in the journal AAPS Pharm. Sci. Tech., [2] stated, "The 2004 PT Section Education Committee took the first steps in addressing the charge: "How can the supply of highly qualified pharmaceutical scientist specialists in product development and related technologies that meet current and future needs be ensured?" This charge was borne out of earlier reports and current experience that suggest that: (1) graduate programs in colleges of pharmacy are increasingly failing to produce sufficient numbers of appropriately qualified specialists in product development and related pharmaceutical technologies and, (2) the pharmaceutical industry has been forced to recruit and train scientists from other disciplines. Surveys conducted by this committee of the membership (PT, PDD and BT sections) and a representative group of pharmaceutical executives validated this concern and provided insight into its nature and depth. As an example, the executives reported that 50% or less of product development staff have undergraduate
degrees in pharmacy and that 50% or less have advanced degrees in pharmaceutical technology, yet entry-level PhDs in these specialties bring a better mix of skills to product development than their counterparts from other scientific disciplines, and that this advantage persist even after 4–6 years experience on the job. And the great difficulty in finding candidates with the right mix of experience and education was also made clear by the surveys," further demonstrating not just the need but in some case a dire need for individuals trained to the PhD level in the Pharmaceutical Sciences.

The dramatic growth of the biopharmaceutical, dietary supplement, nutraceutical, alternative medicine, and alternative health care and related industries over the last 15-20 years has also seen an increase in demand for individuals who have been trained to the PhD level with an emphasis in the Pharmaceutical Sciences to provide advice as expert consultants, managers, quality controllers and to generally guide the industry through the mine field of regulatory affairs and controls.

Aside from the academic and industrial pharmacy routes, qualified individuals will also be able to find employment opportunities in Government, particularly in dealing with regulatory issues, in the food, nutraceutical or dietary supplement arena, as well as in related but diverse areas like the cosmetic, agricultural, fine chemical and veterinary product industries, as well as in future areas that are yet to be defined. The emerging area of biofuels and green industry must also be seen as an industrial opportunity for graduates of our program. Some individuals will opt to become self employed or use their education and training to take them into unrelated areas. In essence any areas where natural materials are used and require analysis, preparation, formulation, marketing and/or synthesis could be employers of our Doctoral graduates.

**Direct Benefits to the State of Hawaii**

The PhD program will:

1. Provide residents of Hawaii the opportunity for the first time to undertake a PhD degree in the Pharmaceutical Sciences within their own State.

2. Significantly help strengthen, stabilize, and sustain the CoP and in so doing ensure both student and faculty retention and potentiation and, as stated by the current Mayor of Hawai‘i, Billy Kenoi, in his letter of support for the establishment of the PhD program, “The addition of the PhD program will open many doors for graduates, enhance the standard of education at the university and improve the quality of life throughout our County, the State of Hawai‘i, and the greater Pacific Region.”

3. Create opportunities, both educational and technological, that do not exist within the State. In particular, the PhD program has the potential to greatly contribute to the technology transfer initiative launched by President Greenwood [6]. An example of this is eluded to by Mr. B. Jacobson, President of the Hawaiian Tea Growers Association, when he says, in his letter of support for the establishment of the PhD program, “Internationally, research on tea and tea compounds are part of the cutting edge work in the Pharmaceutical Sciences. I feel that research undertaken locally on Hawai‘i grown teas and other nutraceuticals will not only benefit our local industries and residents but also promote the standing of our local institutions and our knowledge base from UHH research. Hopefully this work can also help the health of our residents. Hawai‘i is unique in that here we have the ability to grow almost any crop in the world because of our diverse microclimates. Hawai‘i’s farmers can produce agricultural research materials in controlled settings that can be of great use to researchers. This is a very exciting aspect of the establishment of a PhD program in the Pharmaceutical Sciences, within the College of Pharmacy, at the University of Hawai‘i Hilo because it fits so well into the purposes of the Hawai‘i Tea Society.”

Another example of the possibilities for technology transfer are with organisations like those represented by Dr. G. Cysewski of Cyanotech, see letters of support Appendix A. Organisations like Cyanotech are based purely on natural products isolated from micro-algae grown here on the Big Island. Faculty within the College have already had discussions with this company and Cellana LLC concerning possible collaborative research that could be mutually beneficial when the College is better placed to deal with more and varied projects that the PhD program would be offering.
4. Improve links within Pacific Basin Countries and with Asia through collaborative educational and technological research projects. Currently, members of the College have long term collaborations with Pacific Basin and Asian colleagues. The College of Pharmacy is in an ideal situation to further develop these strong ties particularly with Pacific Basin counties and other Asian neighbors who are preparing for the economic recovery as stated in a recent channelnewsasia.com article; "But Asia's biomedical and pharmaceutical sector is using this period to gear itself up in preparation for an eventual recovery. The global pharmaceutical sector is expected to see growth of between four and five per cent this year. But pill processing and other pharmaceutical and biomedical activities are expected to see double-digit growth in Asia." [4].

5. Provide an intellectual resource that is becoming extremely difficult to find. The Pharmaceutical, and related industries are often looking to academia to take a lead in the discovery and initial development of natural products. A PhD program provides an environment well suited to produce results and new ideas many of which would be very attractive to industry and other similar partners. Examples of this are discoveries made by L. Dwoskin of the University of Kentucky's College of Pharmacy [20], H. Luesch of the University of Florida's College of Pharmacy [21], and A. D. Kinghorn of Ohio State University's College of Pharmacy [22].

6. Sustain, extend and enhance the economic and positive healthcare impact the College is already having on the State.

7. Add a degree to the healthcare related professions that is offered nowhere else within Hawaii and so perfectly complement and potentiate those being offered elsewhere throughout the System. This will also ensure that UH is being nationally competitive in an important healthcare area.

8. Attract new industry in the form of new pharmaceutical companies, training organizations, NGOs and governmental agency support for UHH-CoP based technologies.

9. Leveraging the significant investment the State has made and will continue to make in establishing the CoP insures that the program will have a small resource “footprint”, i.e., much of the infrastructure is already in place to begin the program.

10. Establishment of an important legacy for generations to come.

Conclusion of Need

Based on the discussion presented in the previous section of this document it is evident that there is a very clear need for a PhD program in the Pharmaceutical Sciences within the College of Pharmacy at the University of Hawaii at Hilo. Establishment of the PhD program within the College of Pharmacy will significantly help strengthen, stabilize, and sustain the CoP in its mission of becoming a highly ranked college within the US, and in so doing become a foundation for the creation and development of pharmaceutical related business and industry within the State that in the medium to long term can be maintained and expanded by graduates of the program itself.

It is also apparent from this discussion that establishment of a PhD program is going to be essential for successful hiring of further highly qualified faculty and staff as well as for current faculty career development, retention, and leverage of their skills to enable the College to help accomplish significant parts of the stated mission of President Greenwood [6] as well as its own [11].

Appendices A and B contain letters of support for this program from the local Mayor of Hawaii, University of Guam administrators and academics, local academics, individuals from the pharmaceutical and related industries, the private sector, government authorities here in Hawaii, and many potential PhD candidates commenting on the need for a PhD in the Pharmaceutical Sciences in general and specifically within the UH System. A poll of the members of the current Faculty also indicated strong and unequivocal support of this proposal.
8a. Resources: Faculty

The PhD program within the College of Pharmacy formed part of the planning process for the successful establishment of the College and as such plans were made early on for the provision of resources to enable a successful and vibrant PhD program in the Pharmaceutical Sciences to be established. Currently, the College of Pharmacy offers and administers a professional degree in Pharmacy (PharmD) and so has faculty qualified and capable of teaching, mentoring and supporting Pharmaceutical Sciences PhD students and their research, therefore, no additional human resources will needed to begin a PhD program. The addition of a new PhD program will result in the College having a PharmD and a PhD which ideally complement each other. It is also expected that no additional support staff or administrative resources will be required. Existing support staff, the Planning Director of the Graduate Program, and the Admissions and Graduate Program Committees will be able to deal with correspondence, admissions, and administration of the PhD program.

Existing faculty regularly teach significant parts of many of the courses required for the proposed PhD degree within the PharmD program. In addition, all the courses that support core Pharmaceutical Sciences knowledge as well as the new courses that will be required can all be offered by existing CoP faculty. This means no additional FTEs are needed to support the proposed curriculum (See Appendix D and references to Appendices E and F). Courses marked with an asterisk (*) in the course description part of Appendix D indicates some of the lecture materials also form part of the PharmD program.

There are also enough faculty to chair PhD dissertation committees (see below for a list of current faculty). Current faculty who will participate in the PhD program all have appointments in the College of Pharmacy. These faculty members can provide sufficient research infrastructure, laboratory space, and graduate research assistantships for PhD students in the Pharmaceutical Sciences. The expectation is that faculty will draw PhD students directly from our program, form within the State, nationally and internationally.

It is anticipated that the College will be able to provide a limited teaching assistantships to PhD students. It is expected that initially the PhD program will compose 5-10 students all of whom can be supported from current levels of funding within the College.

It is also expected that the availability of PhD level students will greatly increase their attractiveness as graduate research assistants for faculty with funded research programs. With the potential for high research productivity from PhD students, the number of research assistantships should increase to help support the target of 25-30 PhD students. Furthermore, as co-operations and collaboration develop, and the program evolves, new faculty, assistantships, and instructional FTEs could be brought into the program to facilitate further growth. Interdisciplinary proposals for PhD training grants and higher education challenge grants will become possible. The increased potential to develop these kinds of institutional grants as well as interdisciplinary research grants aimed at major funding agencies have the potential to add new resources to the program and the university.

Proposed Faculty for PhD Program in the Pharmaceutical Sciences (See Appendix G for faculty CVs)

Alphabetical Listing of PhD Program Faculty in the College of Pharmacy:

8b. Resources: Physical

Physical space that is available to the PhD Program and its associated faculty include:

**Wainaku Executive Center:** The 2875 sq ft of leased space occupied by the College at this facility houses the Dean’s office, the Director of Continuing Education and Strategic Planning, Director of Community Partnerships, Chair of Pharmacy Practice, six other faculty and three staff members. A large conference room at this facility is also used extensively.

**Interim Modular Facility:** Phase 1 of the Interim Modular Facility on the UHH campus consists of three new buildings. Currently, Building A (4610 sq ft) houses the Student Services and Academic Affairs offices, the IT group office and server room. Office space was recently modified to provide four breakout rooms, each 262 sq ft, for student use. This now provides six breakout rooms of sufficient size to accommodate small group instruction. A photocopy machine and printers for student use are available in this building. Two additional offices (each 131 sq ft) for faculty expansion, storage space and restrooms are also located in this building. Building B (2951 sq ft) consists of a 1900 sq ft lecture hall and adjacent restrooms. Most of the didactic coursework in the College now takes place in this building. Building C (5873 sq ft) represents the College’s research presence on campus. The three research laboratories (each 1200 sq ft) contains the research programs of six faculty members. Six offices for research staff are located adjacent to the laboratories. A 285 sq ft support room is currently being refit to contain another breakout room for student use as well as a small vending area. Two small support rooms and a storage room are also located in this building. A generous gift from the J.M. Long Foundation ($1 M) will help to support construction of Phase 1-B of the modular facility. We will construct a second lecture theatre student laboratory for the instruction of pharmacy practice and pharmaceutics, and additional office and study areas. The current projected completion date is July 2011. A revenues bond has provided $3 million for this project.

**UHH Campus:** The College uses lecture hall UCB-100 (3000 sq ft). Use of this facility will continue until the second lecture hall in Phase 1-B of the Interim Modular Facility is completed. A teaching laboratory, Wentworth 4 (approximately 1500 sq ft) is currently shared with the Chemistry Department. This will continue until a new teaching laboratory is constructed in Phase 2 of the Interim Modular Facility or in the permanent College of Pharmacy building. Additionally, one faculty member conducts his research in laboratory space shared with a member of the Chemistry faculty comprising an X-ray crystallography facility in Wentworth Hall (3A/3B).
Forestry Building, Nowelo Street: The College continues to lease one laboratory (1200 sq ft) and associated office space in this facility. This laboratory houses the Dean's research group as well as some instrumentation used by several other faculty members.

County Annex Building: Office space at the County Annex Building on Rainbow Drive currently houses 14 faculty members, including the Chair of Pharmaceutical Sciences, three staff members and the Pre-Pharmacy Program office. The Dean also maintains a satellite office in this location. Five offices are available for future faculty expansion. Four conference rooms of varying size and two support rooms are also located in this facility.

Waiakea Research Station: The Waiakea Research Station, located five miles south of Campus on Stainback Highway, is a complex of laboratory and office space (7200 sq ft total). This complex of 14 laboratories with associated office and support space is the major site of the College's research activities. While already partially occupied, the complex is undergoing a phased renovation which will restore it to full utility. When fully populated, it is expected that this facility will house the research programs of up to 12 faculty members, an instrumentation laboratory and a fluorescence microscopy laboratory. The Associate Dean for Research and his staff, as well as the Director for Pharmacy Innovation and Facilities Planning, maintain their offices at the Waiakea Research Station.

While it is clear that having facilities and activities spread across five locations spanning the town of Hilo is somewhat less than optimal, the current situation allows us to move forward with both our teaching and research missions. The faculty, staff and students all understand that this is a temporary necessity while we work toward our permanent building. The current situation serves to highlight the importance of the construction of a permanent building to consolidate the College's activities and optimize the relationships of our faculty and staff. At the present time, planning and design is ongoing. The State has released $5.5 million for this purpose. The site for construction has been selected.

8c. Resources: Instrumental and IT

Instrumentation and IT services that will be available to the program include:

Research Infrastructure: Some of the equipment currently available and in use within the College include a Bruker Avance DRX 400 MHz multinuclear NMR spectrometer (a second 400 MHz NMR was recently donated to the College by Wyeth Laboratories and is awaiting installation), a Varian MS500-IT LC-MSn system with ESI and APCI interfaces, a Bruker powder X-ray diffractometer, a Nicolet iS10 FT-IR with Centaurus infrared microscope attachment, a Shimadzu 1800 UV-Vis spectrophotometer, a Rudolph Research Autopol IV multiwavelength polarimeter, a Buchi B-540 melting point instrument, a Beckman Quanta MPL flow cytometer, a Sorvall WX90 ultracentrifuge, 2 Sorvall Legend XTR high speed centrifuges, 2 Sorvall Legend 17R microcentrifuges, Perkin Elmer Cyclone Plus phosphor scanner, Perkin Elmer Geliance 1000 gel imager, Licor Odyssey Infrared Imager, Perkin Elmer Microbeta Filterman-96 cell harvester, Perkin Elmer Microbeta Trilux microplate liquid scintillation counter, Beckman Coulter LS6500 liquid scintillation counter, Stratagene Mx3005P realtime QPCR, 2 BioRad C-1000 thermal cyclers, Biotek Synergy 2, Synergy MX, Microquant and ELx808-NB plate readers, Lumistar luminescence plate reader, Zeiss upright, inverted, stereo and fluorescence microscopes, Olympus and Leica stereomicroscopes, Reichert-Jung Biostar inverted microscope, several New Brunswick I-24, E24 and E24R incubating shakers, several Napco and Fisher Isotemp CO₂ incubators, Fisher Isotemp forced air incubators, several Mettler-Toledo and Shimadzu analytical and top-loading balances, a Cahn Analytical C-35 microbalance, several Heidolph and Buchi rotary evaporators with Lauda recirculating chillers, 2 Labconco Freezone Plus lyophilizers, 3 Savant SpeedVac concentrator systems, several Mettler and Orion pH meters, hotplates, stirrers, vortex mixers and ultrasonic baths, several Yamato and Tuttnauer autoclaves, several Millipore DirectQ-5 water systems, a CEM microwave reactor, a Richard-Allan HM-550-MVP cryostat and a Microm HM-360 microtome. Chromatography equipment includes 6 analytical HPLC systems (one Beckman System Gold, 2 Shimadzu Prominance, 2 Dionex Ultimate 3000, 1 Perkin Elmer Series 200) with PDA, UV-Vis and/or electrochemical detectors, Shimadzu and Varian ELSD detectors, ESA Coulometer-III electrochemical detector, 2 Shimadzu preparative HPLC systems, a Buchi MPLC system, a BioRad Duoflow FPLC system and a Kromaton FCPC-A200 HPCPC system, a Rigaku LN40 liquid nitrogen generator to support the NMR laboratory. Numerous refrigerators, -20 freezers, -80 freezers and liquid
nitrogen storage systems are also distributed among the laboratories. This list does not include smaller items such as electronic pipettes, and any items considered disposable. The College will continue to invest in its research infrastructure to the limits of the available budget in order to provide state-of-the-art laboratory capabilities for all of its faculty members.

Appendix H contains a definitive comprehensive listing of all equipment within the college as of June 30, 2010 that cost more than $5000.

IT Infrastructure: IT Infrastructure includes three Apple XServe servers, one Mac Pro Server, an XServe RAID and a Tape Backup unit, as well as each faculty and staff member having access to either a Mac or PC, laptop or desktop computer. This equipment is located in the Interim Modular Facility and being upgraded to the current server operating system. Servers now support BLOGs, WIKIs, VPN and web-based calendars in addition to other services. The IT infrastructure is currently maintained and supported by two full-time staff members with a third being recruited during the present school year.

8d. Resources: Admissions and Student Services and Counseling

Organization of Student Services: The UHH-CoP Office of Student Services (OSS) is staffed with a Director of Student Services (DSS) who supervises one full-time Academic Advising Specialist, one full-time Admissions Counselor, and two part-time student employees. The CoP is in the process of recruiting two additional student service employees to meet the student service needs of the growing College of Pharmacy. The Director of Student Services reports to the Associate Dean for Academic Affairs. The OSS has conducted and coordinated the recruitment, admissions and student services processes in conjunction with CoP committees (e.g., Admissions Committee and Awards & Scholarship Committee) as well as UHH Departments (including Financial Aid, General Admissions, University Registrar, Student Services, New Student Programs Office and the Business Office). The staff of the OSS addresses the needs of prospective and incoming students as well as aids the current students in their progression through their degree program. Additionally, the student employees assist the staff in the OSS to prevent potential backlogs of administrative processes. The Director of Student Services will continue to direct and coordinate the necessary processes and planning in order to best allocate resources to meet the recruitment, admissions and student services needs for the CoP. The CoP OSS will continue to build and implement student support structures that specifically address the needs and concerns of CoP students. Everyone employed in the OSS is made knowledgeable of FERPA law and its requirements, and student records are maintained in compliance with FERPA law.

Student Services Offered: The CoP Office of Student Services works in conjunction with the UH Hilo Division of Student Affairs in order to offer CoP students the broadest and most comprehensive range of services and to encourage their academic and personal success while at the UHH-CoP. A complete list of services available and offered to our students can be found in the Appendix I.

Academic Advising and Career Counseling for PhD Students: Academic and career advising and counseling is facilitated through faculty advisors who are able to effectively address the specific academic and career concerns and questions for CoP students. Faculty advisor responsibilities include:

1. Serving as the student's advisor and academic/professional counselor.
2. Overseeing and monitoring the academic progress and professional growth of the student.
3. Assisting the student in seeking academic and personal counseling services provided by the institution.
4. Serving as an advocate for the student when appropriate.

Advising of students is required of all UHH-CoP faculty members. Faculty advisors meet with each student individually at least once per semester. In addition to faculty advisors, the Dean and Associate Deans as well as other faculty members will also be available to assist students with academic advising, counseling, enrichment, and non-academic concerns.
UHH Career Planning and Placement: The Career Center provides support and assistance to students in the career planning and job placement process. The Center provides resources for career exploration, including self-assessment inventories, access to career exploration software, and access to a library for career exploration and graduate/professional school planning. The Director organizes a variety of career-oriented activities, such as bi-annual job fairs and workshops on topics such as resume writing which are offered throughout the academic year, and a career website that allows employers a free place to advertise positions to students and alumni.

The Career Center also administers the student employment program. Funds are available through both the Federal Work-Study Program and from University General funds for students to work part-time in various jobs on campus. The Center also provides referrals to off-campus employment opportunities.

Financial Aid: Financial aid at UH Hilo is designed to provide financial assistance to students who would not be able to attend college without such assistance. In conjunction with the CoP Office of Student Services, the Financial Aid Office provides support for the College of Pharmacy by administering the financial aid application and awarding process, as well as providing financial aid counseling to prospective and currently enrolled students and their families. Financial aid may take the form of scholarships (based on both need and merit), grants, loans, or work-study programs.

Scholarship Program: In coordination with the UH Foundation Office, UH Hilo Financial Aid Office and the Office of Student Services, the CoP administers scholarships to students. The purpose of the UH Hilo College of Pharmacy scholarship program is to recognize and reward students who have demonstrated outstanding academic performance and have shown a commitment to leadership and community activities within the college. Many awards also consider financial need. The scholarship awards imply the expectation of continued exceptional performance and leadership by the recipients in the years ahead. Scholarships are contingent upon availability of funds and the continued commitment of our generous sponsors. All UH Hilo CoP scholarship funds come from a variety of sources such as private donors, professional associations, and state and local business firms.

Housing: College of Pharmacy students are eligible to reside on campus in University residence halls. On-campus housing includes traditional dormitory style residence and apartment-style accommodations. The Housing Office also administers an off campus housing program which includes several nearby privately owned apartment complexes. In addition, the Housing Office maintains a listing of off campus residences and apartments that have vacancies, and provides referrals to students for these accommodations. A range of meal plans are available to students who reside on and off campus, and are provided in two dining halls on campus.

UHH Student Support Programs: A variety of student support programs are administered through the UH Hilo Division of Student Affairs, including the Student Support Services Program, the Kipuka Native Hawaiian Student Center, and the Minority Access and Achievement Program. These programs target students who may need additional support to be successful in college, such as first-generation college students, low-income students, Native Hawaiians, and students from ethnic groups that have historically been under represented in higher education. Students in the CoP are eligible for participation in all of these programs that provide a range of services, such as peer tutoring, peer mentoring, assistance with obtaining financial aid and scholarships, academic counseling and advising, study skills workshops, social and educational enrichment activities, and field trips. Tutoring is also available on campus through the Kilohana, Academic Success Center whose mission is to improve learning and retention through course specific assistance, tutoring, and skill development workshops. Kilohana also supports the Math Lab and the Writing Center which offers free drop in tutoring for all UH Hilo students.

UHH Counseling: Counseling staff assist students in academic, career and personal areas of development. Students experiencing academic difficulties or any of a variety of personal problems (relationships, depression, and anxiety) can contact the Counseling Center. Counselors will work with students directly or may refer students to other resources. PharmD students will access UHH counseling services as appropriate via self referral and/or faculty mentors.

Health Services: UH Hilo students may take advantage of a wide range of health services provided on campus by a full-time nurse and two part-time physicians. Services include health insurance information, TB tests and routine immunizations, first aid for illness and injury, health and wellness information,
pregnancy testing, sexually transmitted diseases testing, contraception, and referral to off-campus health care if necessary.

UHH Student Life: The Campus Center serves as the hub of campus life/ activity for students, faculty and staff as well as the general community. Student life programs, services and activities are an integral part of the UH Hilo student’s total educational experience. The Center provides support and assistance to the student-led UH Hilo Student Association, Student Activities Council, Advocacy Council for Students, student mediation center, Ke Kalahea (student newspaper), Kanilehua (student literary and art magazine), Hohonu (student academic journal), Board of Student Publications, Student Service Corps, Board of Media Broadcast, Campus Center Fee Board and all registered independent student organizations. Leadership training is provided to students to assist them with developing their leadership skills and abilities. The service-learning program enables students to broaden their educational experiences by engaging in service activities both on and off campus. The Campus Center facility serves as the “living room” of the campus with convenient food service, meeting rooms, big screen television, indoor and outdoor gathering spaces and lounges, computer stations, and a computer lab.

The University also offers recreational and intramural sports programs. Additionally, the Student Life Center (SLC) provides an open, safe environment for recreation, learning, and social interaction. This beautiful facility consists of nearly 23,000 square feet of indoor fitness/recreational rooms, a cardio and weight room, dance and aerobics rooms, a lounge with wireless internet, an indoor café, locker rooms, an Olympic-sized swimming pool, and an open deck by the swimming pool. The SLC also runs an Outdoor Adventure program which provides a wide range of outdoor activities and programs at a variety of skill levels for the UHH community. Participants have the opportunity to explore the Big Island by participating in diverse adventure trips. They also can develop skills and learn safety and proper technique for a variety of activities through classes and workshops (e.g., Kayaking, SCUBA, Mountain Biking, and Ocean Canoeing to name a few.)

Testing: UHH serves as a testing site where students and individuals from the community can take standardized tests such as the Graduate Record Examination, Medical College Admissions Test, Pharmacy College Admissions Test and Law School Admissions Test. These tests are offered periodically throughout the year. Test proctoring services are also available for students who are enrolled in distance education courses at another institution. Placement tests to enter English, Mathematics, and Chemistry courses are administered by the respective academic departments at the University.

Disabilities Services: The University Disability Services Office provides services and support to students with disabilities, in compliance with Section 504 of the Rehabilitation Act (1973) and the Americans with Disabilities Act. Services focus on determining and providing reasonable and appropriate accommodations. The office also serves as an advocate for people with disabilities at UH Hilo by providing consulting on facilities development and planning; public accommodations for campus programs, services, or activities; educational and awareness programs; and general support for diversity activities at the institution. Course Coordinators are kept informed through the University Disability Services Office if any student needs any additional support due to a disability.

International Student Services: The International Student Services office assists international students in clarifying and attaining their personal and academic goals while complying with regulations pertaining to their immigration status. The office serves as an interface between UH Hilo and international students to facilitate communication, understanding and appreciation. The office promotes cross-cultural activities on campus and conducts orientations and workshops to assist students in their cultural adjustment to life at UH Hilo. Though they are not required to have visas, students from the US-affiliated Pacific Islands are included in the population serve by the International Student Services office.

Women's Center: The Women’s Center is committed to supporting the leadership, safety, empowerment, and intellectual growth of women at UH Hilo through educational programs, advocacy, direct services, and policy development. Working collaboratively with other campus programs and community agencies, the Center serves students, faculty and staff on issues relating to women and gender equity.

8e. Resources: Library
As the majority of the resources required by this PhD program are already available to our current Professional Students and CoP Faculty, there will only need to be a modest increase in Library resources, see documents of resources and support from the current librarian (Appendix J).

9. Program Parameters

The core group of disciplines that make up the Pharmaceutical Sciences are pharmaceutics, medicinal chemistry, pharmacognosy, and pharmacology. Individuals with expertise in these areas will always play a key role in providing products and services to consumers, medical professionals, government policy makers, Government regulatory and enforcement bodies, research scientists, and a multitude of private industries related primarily to healthcare but also to associated areas that deal with dietary supplements, cosmetics, fine chemicals, agriculture, animal health and there like. To help provide such products and services and to improve the health of people in Hawaii and the Asia-Pacific region, as well as the nation as a whole, we have designed a PhD program to take the best advantage of our location and resources. Primarily, the program is designed to prepare future leaders in these areas of expertise who can expand our knowledge base concerning the Pharmaceutical Sciences in a general sense but with an emphasis on natural products and their use in traditional healthcare and natural healing systems. In so doing the program will help with the discovery, synthesis, analysis, preparation, delivery and development of new and known chemical entities as products or leads to new products. It is also expected that new approaches to drug discovery, analysis, synthesis, analysis, preparation, delivery and development will also be developed, and that existing approaches will be refined and improved upon.

To ensure that graduates are prepared for these undertakings, students will be expected to demonstrate (1) a comprehensive understanding of core Pharmaceutical Sciences knowledge, (2) advanced scholarship in a specialty area (pharmaceutics, medicinal chemistry, pharmacognosy, and pathophysiology) with an emphasis, where appropriate on one of the other topic areas too, and 3) appropriate exposure to social and career-building disciplines (e.g., education, communications, information technology, technical writing, behavioral sciences). Students will also be expected to conduct original scholarly research, develop skills in research methodologies and grant writing, understand research ethics, and be able to dissemination research findings to others via peer-reviewed publications, participation in local and national scientific conferences and other practical applications. The specific admission and degree requirements needed to gain admission into the program follow.

9a. Admissions. The admission process will be considered a key step in ensuring the success and quality of the program and its graduates; consequently, applicants will be carefully evaluated and selected. Students will need to submit all of their application materials to the UHH CoP PhD Program Admissions Committee, who will select entrants into the program. This Committee is made up of the highest quality faculty with proven records in mentoring successful graduate students. The admission criteria and procedures will conform to the UH Graduate Division’s standards doctorate programs. To ensure consistent quality of training and financial support, the number of applicants admitted will be kept in line with the availability of dissertation advisors and available support (i.e., funding to support the student for 4-5 years). A student cannot be admitted into the program by the Admissions Committee in the absence of a plan to support them and evidence of a good “fit” between the student’s needs and interests, and a faculty member’s ability to serve as a dissertation advisor and mentor. It is anticipated that 5-10 doctoral students will be admitted into the program each year reaching a total enrollment of about 25-30 students when the program matures.

Applicants should have a BS, MS, PharmD and/or equivalent degree. Additional admission requirements include; successful passing grades in General Biology I and II for Science Majors with Labs, Human Anatomy and Physiology I and II with Labs, Microbiology with Labs, General Chemistry I and II for Science Majors with Labs, Organic Chemistry I and II for Science Majors with Labs, Calculus 1 or Advanced Calculus, a minimum grade point average of 3.0 out of 4.0 (exceptions may be granted on a case by case basis), submission of GRE general test scores that demonstrate performance above the 50% percentile, three positive letters of recommendation including one from a Professor of one of the Natural or Physical Sciences, and a completed Graduate Admissions Application including a personal statement of objectives and resume. Foreign applicants must obtain a TOEFL score of 600 or above. Interviews in person will be
required of all applicants deemed admissible by the Admissions Committee for the PhD in Pharmaceutical Sciences. In selecting applicants for admission, particular attention will be paid to the quality and depth of the personal statement, the strength of the letters of recommendation (i.e., they must indicate exceptional potential) and the professional qualities and academic depth presented in the personal interview.

9b. Degree requirements. The principal requirements for the PhD degree are: (1) During first, or qualifying year in the program obtain an overall grade of B or better when all Core courses and one elective have been completed, (2) complete required coursework, (3) pass a comprehensive exam to demonstrate advanced scholarship in the field, and (4) defend a doctoral dissertation that presents original, independent research. In addition, all PhD candidates will be required to participate in a substantial teaching project with a faculty mentor during at least one semester of their program.

Qualifying Year. The purpose of the Qualifying year is to determine whether the student has the necessary background to proceed with a doctoral program and to enable their selected Major Professor and other advisors to assist the student in planning their program of study. The Core subjects and electives may be examined by oral and/or written examination as decided by the examining committee. All students entering the program with a BS degree will be required to pass the first, or qualifying year with a grade of B or better. Candidates entering with an MS or higher degree must also pass the first, or qualifying year with a grade of B or better. PharmD graduates entering from the UHH CoP program are exempt from the exam, as suitability for the PhD program will be based on their successful completion of the PharmD program.

Also during this year students must select a Major Professor. This selection process is started in first year Fall Semester by the student first visiting and interviewing with each of the faculty members in the Department. These interviews will help the student become acquainted with the individual faculty members and to learn of their research interests. As they approach a final decision on the selection of a Major Professor, they are encouraged to talk more than once with those faculty members of particular interest. Once a Major Professor is selected students are expected to start their research in the summer of their first academic year. Until a Major Professor is selected the Director of the PhD Program will serve as the student's informal advisor.

Research proposal defense. All students will be required to defend their dissertation research proposal and, where applicable, research progress to the satisfaction of their dissertation committee. They must do this after they pass their qualifying year, and before they complete their second year. This defense will serve as a capstone, and assure that the student can demonstrate sufficient research skills and knowledge of the research plan to proceed with the dissertation research.

Required course work. The required course work, research defense, and qualifying year described above will assure that all students obtain sufficient core knowledge and introductory research skills to proceed toward the PhD degree. After the above requirements are met, all PhD students will be expected to take a recommended minimum of 40 (24 being the official recommended minimum) credits of graduate level coursework (excluding research credits) as described below:

- 19 credits of graduate level core coursework
- 12 credits of courses related directly to their research topic
- 2 credits related to publication and grant preparation
- 4 credits of approved electives
- 3 credits of directed reading and research assignments (Seminars)

The student in consultation with his/her dissertation advisor will decide on the specific courses selected to meet satisfactorily meet program requirements. An example of a typical course of study for a student entering the PhD program is shown in Appendix D.

To foster the development of teaching skills, all PhD candidates must also participate in a substantial teaching project during at least one semester of their program. All students who are not paid teaching assistants are required to develop, with a willing instructor of their choice, an instructional experience equivalent to a half time TA. At the conclusion of the experience their instructional mentor must submit a
written evaluation of their performance to the Director of Graduate Studies. Unsatisfactory evaluations will result in the need to repeat the experience until a favorable evaluation is achieved.

**Comprehensive exam.** When candidates have completed all, or most of their coursework toward the PhD, they must pass a comprehensive exam. The timing of the exam will be decided upon by the student in consultation with their advisor. The purpose of this exam is to determine the student's comprehension of fundamental Pharmaceutical Sciences knowledge, theoretical expertise in their research discipline, and competence in research, communications, and critical thinking skills to ensure that they can excel as a professional in the field. The form of the exam will be both written and oral. It will be conducted by an examination committee composed of at least three members of the faculty (including the student's advisor) with collective expertise to cover the range of expectations listed above. The composition of the Committee can be proposed by the student in consultation with their advisor. To ensure the quality and consistency of exam committees, its composition must be approved by the Director of Graduate Studies. The time frame and grading of the exam will be decided by the committee. The examination criteria and procedures will conform to UH Graduate Division's standards for doctorate programs.

The student must pass this exam to remain in the PhD program. The exam is repeatable once after successful petition to the Director of Graduate Studies.

**Dissertation.** All PhD candidates must conduct scholarly, independent, original research that contributes new knowledge to the field. The candidates develop and conduct research projects under the direction of their dissertation advisor and committee. At the conclusion of the research, students write a dissertation, i.e., a scholarly presentation of their research in publication form. The student’s dissertation committee then conducts a final examination to assess the student's ability to orally present their dissertation in a seminar format and defend their research and dissertation. The final exam is repeatable once after successful petition to the Director for Graduate Studies. The final exam criteria and procedures will conform to the UH Graduate Division's standards for doctorate programs.

**9c. Program Administration**

The PhD in Pharmaceutical Sciences will be housed within the University of Hawaii at Hilo's College of Pharmacy. The current planning Chair of this program will serve as the program's first Director and will be responsible for day-to-day leadership and administration of the program. The Program Director will Chair the Graduate Program Committee that will have the responsibility to propose policy and facilitate program development. If needed, the Committee may choose to add additional members drawn from the faculty involved in the Program. The Graduate Program Committee will seek input from, and poll the faculty for approval of any major proposed changes in program policy or requirements. As with all graduate programs, overall administrative leadership will come from the Graduate Division.

**10. Program Efficiency**

From the information presented in the spread sheets found in Appendix K it is evident that the program in the short to medium term will essentially be financially neutral. While being financially neutral the program will in other ways start to be extremely profitable in terms of generating economic and educational prosperity within the State of Hawaii. As said throughout this document the College of Pharmacy is already generating significant revenue for the University and the community and with the addition of a PhD program this quality of the College will be further enhanced. PhD students will enable faculty to better use their time and also increase the chances for making unique scientific discoveries as well as facilitate the production of many more research results than one faculty member could ever produce alone. These discoveries and results will be used to support grant applications and also to leverage support from other potential funding organizations. It is also likely that in the medium to long term organizations from the both the private and public sectors will approach the College for partnerships, collaborations and consultations all of which will further enhance the overall efficiency of the program. Once graduated, our students will all give back to the program, and hence the State, in kind throughout the rest of their careers. This latter quantity is extremely difficult to estimate as efficiency but it is clear that the graduates never stop giving back in some way to the PhD program they graduated from.
Aside from these obvious efficiencies it is expected that the establishment of a PhD program will greatly assist with faculty retention, a variable whose significance cannot be undervalued. Every time a faculty member has to be replaced the cost to the overall system is significant, so any step that ensures faculty remain productive, stable and content in their activities should be embraced. Faculty here within the College, especially those in the Pharmaceutical Sciences Department, are here because of the potential of being part of a full academic program, this means one that offers a PhD. Without this program the effects on faculty retention are potentially disastrous, and could potentially generate some major faculty turn-over.

In conclusion, it is expected that the PhD Program in Pharmaceutical Sciences will generate a great deal more for the State of Hawaii at all levels than its initial start up may cost.

11. Program Quality and Evaluation

The most important aspects determining the quality of a PhD program are the quality of its faculty and their resources. It is evident from the current faculty in Pharmaceutical Sciences listed Section 8a, that the potential for a quality program exists at in the College of Pharmacy at the University of Hawaii at Hilo.

All current faculty obtained their PhD degrees from programs within highly regarded Universities either Nationally or Internationally. The faculty know from their extensive experience what a quality PhD program in the Pharmaceutical Sciences entails and can provide quality mentorship for students in the program. Currently, all faculty are successfully training PharmD and Post Doctoral Research Associates in the Pharmaceutical Sciences.

The quality of the overall faculty and their resources can be seen in their CVs found in Appendix G.

11a. Evaluation Benchmarks for Program Progress

The program will be expected to reach benchmarks of quality and productivity at the time of provisional review that show it emerging in the upper half of Pharmaceutical Sciences PhD programs in the Nation. Benchmarks are listed below. The data given represents an average from queries made of Graduate Chairs of seven (7) PhD programs in the Pharmaceutical Sciences considered to be in the top 50% nationwide (Rugers University, Purdue University, Oregon State University, University of the Sciences in Philadelphia, University of Utah, University of Illinois at Chicago, Temple University), and of the Chemistry Department at UH Manoa.

**Benchmarks:**

Results for Benchmark questions from seven (7) high ranking Colleges of Pharmacy for the last four (4) years and UH Manoa Chemistry Department:

11b. Program Assessment

The program will be assessed using the benchmarks and assessment steps listed in Section 11a., and the post-graduate survey instrument shown in Appendix L.

12. Student Assessment

The following steps will foster and assess students' progress:

**Learning Outcomes.** The learning objectives of the program are to have students demonstrate mastery of fundamental knowledge in the Pharmaceutical Sciences as well as advanced scholarship in their specialty area. In addition, students will be expected to be able to communicate both orally and in writing at a high level of proficiency, conduct and interpret scientific research data, and function as a professional in the Pharmaceutical Sciences.

**Publication of Learning Outcomes.** The above learning objectives will be published in the program summary sent to all prospective students, on the program's departmental website, and in the program's Guide For Graduate Students given to all prospective and admitted students.

**Mapping Learning Outcomes into the Program.** Fundamental knowledge in the Pharmaceutical Sciences is mapped into the program by requiring prerequisite degrees in basic science and related disciplines in the students undergraduate, MS, and PharmD preparation. An oral candidacy exam conducted by faculty with expertise spanning all areas of the Pharmaceutical Sciences is administered early in the student's program and any deficiencies in fundamental knowledge uncovered in the exam are required to be remedied by additional coursework or other appropriate approaches like independent studies, teaching assistant duties, faculty mentoring, or internships.

Advanced scholarship is mapped into the program by requiring at least 24 credits of graduate level coursework in the Pharmaceutical Sciences as well as 12 credits in interdisciplinary courses related to the student's specialty area and two credits in career building skills. Scholarship in the student's specialty area is mapped in by the Chair of the student's Dissertation Committee who guides the student in the selection of elective courses to shape that specialty area, as well as by mentoring the student in that area during the research and thesis writing processes. When candidates have completed all, or most of their coursework toward the PhD, they must pass a comprehensive oral and written exam. The purpose of this exam is to determine if the student can demonstrate advanced scholarship in the Pharmaceutical Sciences, expertise in their research discipline, and competence in communication and professionalism. A student must pass this exam to remain in the PhD program.

Oral communication skills are mapped in by requiring the students to enroll in at least three Pharmaceutical Science seminar classes where they present a critical evaluation of a selected topic, by the oral candidacy and comprehensive exam questions, by requiring all students to act as a teaching assistant during at least one semester of their program, by requiring an oral presentation of their dissertation research at their final exam, and by presentations at national conferences. Written communication is mapped in by writing assignments and essay type exams in courses, a written proposal for the student's research, written answers on qualifying and comprehensive exams, a written PhD dissertation required for the final exam, and by research articles submitted for publication.
Proposal for PhD Program in Pharmaceutical Sciences 10/27/2010

Conducting Pharmaceutical Science research is mapped in by the requirement of a scholarly, independent, original dissertation research project conducted under the guidance of a research mentor (Chair of the dissertation committee) and a Dissertation Committee. Interpretation of research is mapped in by seminar courses requiring the oral presentation of a research paper or proposal, by proposal writing, by journal clubs, by the literature review required in the dissertation and in research articles submitted for publication.

The ability to function as a professional in the field is mapped in by the requirement of passing both a candidacy exam and comprehensive exam to demonstrate professional scholarship and communication skills, the requirement of at least one semester as a teaching assistant and three seminar presentations to demonstrate presentation and pedagogical skills, the production of an original, independent, scholarly dissertation, and the expectation to publish in peer-reviewed journals and present research findings at national conferences to demonstrate professional research skills.

Assessment events:

a) Candidacy Exams. Prior to the exams, the student's advisor and the Examination Committee review the student's academic progress. The purpose of this process is to ensure that the student has enrolled in, or plans to enroll in, the proper required courses. In addition, timely progress on the student's proposed research is also evaluated. The candidacy exam itself is used to evaluate if the student has a mastery of fundamental knowledge in the Pharmaceutical Sciences and related fields, and can express this knowledge in a professional manner. If any deficiencies in fundamental knowledge or communication skills are uncovered, then the Examination Committee recommends coursework, independent study, mentorship by a faculty member, seminar presentations, or other appropriate means to remedy the deficiency.

b) Required research defense. All students enrolled in the Program will be required to orally defend their dissertation research proposal and, were applicable, research progress to the satisfaction of their Dissertation Committee. They must do this after they pass their candidacy exams. This will assure that the student can demonstrate sufficient research skills and knowledge of the research plan needed to proceed with the PhD dissertation.

c) Required Seminar Presentations. At least three seminar presentations focusing on research literature are required in the student's program. These presentations are used to evaluate the student's ability to interpret research literature and present literature reviews in a professional format using appropriate oral and visual (e.g., PowerPoint) communication skills. The presentations are used by the seminar instructor and the student's advisor to evaluate the student's proficiency and potential need for further development.

d) Required Teaching Assistant Experience. All students are required to assist a faculty member with instructional-related work for at least one semester during their program. The faculty member and the student agree on a set of instructional-related duties prior to the start of the semester. At the end of the semester, the instructor evaluates the student's performance in writing with a copy forwarded to the Director of the graduate program. If the evaluation is unfavorable, the experience must be repeated until a favorable evaluation is achieved. This teaching experience is used to evaluate the student's ability to work in a professional educational context.

e) Comprehensive exam. When candidates have completed all, or most of their coursework toward the PhD, they must pass a comprehensive oral and/or written exam. The Dissertation Committee conducts the exam. The purpose of this exam is to determine the student's comprehension of fundamental Pharmaceutical Sciences knowledge, expertise in their area of specialty, and competence in research, communications and critical thinking skills to insure that they can excel as a professional in the field. A student must pass this exam to remain in the PhD program.

f) Dissertation defense/final exam. This culminating experience evaluates the student's ability to conduct and present original, independent, scholarly research in a professional manner. The Final Exam Committee evaluates these abilities by reading the dissertation, listening to the oral presentation, and conducting an oral exam covering all aspects of the dissertation and presentation. If any aspect of the final exam is unsatisfactory, the student is asked to remedy the situation. This may involve rewriting, conducting more research, preparing a new presentation, or enhancing their understanding of the research in order to demonstrate that they can function at the professional level as a researcher in the field.
Contributions to discipline:

a) Publications. All PhD students contribute to the discipline by publishing a dissertation. It is expected that all PhD graduates will publish at least two articles in a peer-reviewed professional journal.

b) Presentations at professional conferences. It is expected that all PhD students present their research at a national or international research conference sponsored by professional research organizations in the field such as the American Society of Pharmacognosy. Additional presentations will also be made in the CoP symposium series.

Monitoring student post-graduate professional activities: A survey instrument has been developed, see Appendix L, to monitor post-graduate professional activities and obtain feedback on satisfaction with the PhD program.
13. References and Notes

[12] This is apparent form the millions of dollars or research funding awarded each year by NIH and NSF to drug discovery programs throughout the United States. Visit NIH and NSF home pages for more information.

[14] Information for 2010; provided by Margaret Shiba, Senior Director of Development, University of Hawai'i at Hilo.

[16] Survey was conducted using Survey Monkey®: http://www.surveymonkey.com

[20] Dwoskin, L. of the University of Kentucky's College of Pharmacy: see CV and references and patents therein.

[21] Luesch, H. of the University of Florida's College of Pharmacy: In January, the Luesch group from Florida reported (J. Am. Chem. Soc., 130 (6), 1806-1807, 2008,) the isolation and characterization of an antiproliferative natural product called largazole. Subsequently, largazole has been synthesized and found to be an inhibitor of HDACs (J. Am. Chem. Soc., 130 (26), 8455-8459, 2008.). The compound is moving towards clinical trials.

Appendix M

Approved ATP
AUTHORIZATION TO PLAN (ATP) AN ACADEMIC PROGRAM (Revised 06/12/07)
Please complete all sections with an emphasis on items 7, 8, 9 and 10. The ATP is not to exceed 5 pages.

This ATP was approved by College of Pharmacy Curriculum Committee, the College of Pharmacy faculty as a whole, and the Dean of the College of Pharmacy.

1. School/College and Department/Unit
   College of Pharmacy (CoP), Department of Pharmaceutical Sciences

2. Chair/Convener of Planning Committee
   Anthony D. Wright, PhD

3. Program Category: _X_ New ___ Modified ___ Interdisciplinary

4a. Degree or Certificate Proposed:
   PhD in Pharmaceutical Sciences

4b. List similar degrees or certificates offered in UH System:
   There are no similar degrees offered within the UH System.

5. Planning
   a. Planning period (not to exceed one year or reapplication is necessary)
      Three months from the date of this submission.
   b. Activities to be undertaken during the planning phase
      • Curricula and course development
      • Outreach to existing faculty
      • Review recruitment needs
      • Development of Dissertation topics
      • Secure short to medium term funding and establish procedures to maintain long term program funding
      • Assess need-outcomes (Undergraduate and Professional Students)
      • Creation of WASC submission
      • Submission of documentation to WASC
      • Notification to ACPE (Accreditation Council for Pharmaceutical Education) that this planning is occurring and that
        the program will enhance the PharmD program in the CoP
      • Develop a rigorous admissions process
      • Develop a grading system for didactic and research credits
      • Create procedures for Dissertation defense
      • Create guidelines for Graduate Study
      • Develop a brochure for the program
      • Establish/Create UHH Catalogue entries
   c. Submission date of program proposal
      Three months after authorization is obtained.
   d. Workload/budget implications during planning period
      The planning will be mainly undertaken by Dr. Wright as part of his regular CoP duties with the assistance of
      a committee as required. There are no budgetary implications.

6. Program Description (Objectives and relationship to campus mission and strategic plan)
   This program will provide graduate training in the Pharmaceutical Sciences for students with a PharmD, MS, or Baccalaureate Degree, and those currently working in the field. Studies will culminate with the award of a PhD in Pharmaceutical Sciences. The program will utilize the extraordinary intellectual, biological, physical and cultural diversity on the Island of Hawaii, and within both the State and Pacific Region, as a focus of investigation and study.
The program will prepare students for senior positions in academia, education, government, industry and any related fields.

Program objectives:
- To provide an important course of study available nowhere else within the State of Hawaii.
- To enhance academic rigor and scholarship within the CoP and the UH Hilo in general.
- To leverage the research expertise of CoP faculty.
- To advance the science of Pharmacy and Pharmaceutical Sciences.
- To foster knowledge of current trends and issues in Pharmaceutical Sciences including basic and applied research and natural resources issues.
- To provide participants with experiences in conceptual and technical research areas in the Pharmaceutical Sciences, e.g., Pharmaceutics, Pharmacognosy, Medicinal Chemistry, Pharmacology, as well as in exploring the natural environment, marine and terrestrial, for potentially economically important natural products.
- To promote research and scholarly activities that will enable participants to successfully pursue a career in the pharmaceutical and related industries.
- To offer new career training options to undergraduate and pharmacy students within the UH System, Statewide and throughout the Pacific Basin.
- To develop methods and/or innovations in analytical processes and technologies relevant to natural product research and discovery.

Graduate Students within the program will:
- Develop advanced skills in the Pharmaceutical Sciences.
- Perform scientific research that will advance knowledge in the interdisciplinary field of Pharmaceutical Sciences.
- Be educated and trained to use advanced technological equipment in order to perform quantitative analysis and be able to interpret complex data.
- Present research findings at local, national and international forums.
- Interpret and critique professional scientific literature.
- Undertake an original individual research project leading to a PhD Dissertation.
- Pass qualifying exams by the end of their third academic year.
- Successfully defend their Dissertation.

Strategic Plan, University Mission, and Service to the University and Community:
The proposed graduate program is consistent with UH System Strategic Goals and the mission of UH Hilo.

UH Goal 1: Educational Effectiveness and Student Success: This program will enable residents of the State of Hawaii to attain the PhD degree without having to leave the State. This will remove a formidable barrier to graduate training for many, especially nontraditional students with families and/or job responsibilities in Hawaii. The program will also support UH Hilo's primary mission of providing an excellent undergraduate education as it will enrich existing UH Hilo undergraduate programs with supplementary courses and activities. The programs in Biology, Chemistry, and Marine Science, will benefit immediately, with those of the College of Agriculture, Forestry and Natural Resources Management benefiting in the future. Honors students and advanced undergraduates will be allowed to participate in selected activities in the new graduate program, where appropriate.

UH Goal 2: A Learning, Research, and Service Network: This program will advance and extend the research and scholarly productivity of the UH System in general and the State of Hawaii as a whole. In the medium to long term the program will also have a wider economic impact through fostering the intellectual capital here in the State of Hawaii. As more and more graduate students participate in the program, providing services to local industries, government agencies, as well as to other countries and territories in the Pacific Basin new investments will be attracted to Hawaii.

UH Goal 3: A Model Local, Regional, and Global University: The program will advance student understanding of the natural environment in Hawaii with a special reference to the Island of Hawaii. The graduate courses and graduate student research projects will to varying extents utilize the natural resources and environment of the Island of Hawaii and interactions with Federal, State and non-profit agencies to augment the program through access to research and course projects and expertise. The program, strategically positioned, and expertly staffed, on the Big Island, will be available to everyone in the Pacific Region and in so doing is ideally positioned to become one of the world's foremost multicultural centers for the advancement of local, national and global studies of the natural environment.

UH Goal 4: Investment in Faculty, Staff, and Their Environment: For CoP faculty and staff a PhD program of this nature is essential for the recognition of UH Hilo at all levels. Establishment of this program will provide the opportunity for faculty to continue their logical academic development to the highest level.
7. Program Justification (Needs and Rationale. Include, as appropriate, internal and external factors driving need for this program; description of needs assessment; number of interested student per year; need for such a program in relation to workforce development, graduate studies, etc.)

The creation of a graduate program offering the PhD degree is the next logical step in the academic development of the UH Hilo CoP. Currently, the PhD degree in Pharmaceutical Sciences is the recognized entry level degree necessary to assure that graduates are competitive in the current job market for scientists able to develop, lead, and direct independent research in industrial, academic, educational and government settings, locally, nationally and internationally. Indeed, it is an essential step toward fulfilling the mission of the CoP, which is to educate pharmacy practitioners and leaders, to serve as a catalyst for much needed innovations and discoveries in pharmaceutical sciences and practice for promoting health and well-being, and to deliver quality patient care, as it solidifies our intentions of enhancing the research capabilities of UH Hilo. Only through an active graduate program will the CoP and its faculty be able to fulfill their obligations to expand the essential knowledge-base of the local, national and global medical community and produce highly skilled researchers, practitioners, and teachers who continue the advancement of biomedical science. It should also be noted that in current nationwide PharmD programs, pharmacists are no longer being trained to be researchers in the Pharmaceutical Sciences. This means there is already a projected need for the researchers who will graduate from this program.

A graduate program in the CoP will open many doors for our students and faculty. One of the primary duties of a university is to train the next generation of scientists and teachers — graduate students and postdoctoral fellows who will be pursuing research in the College under the supervision and mentoring of the academic faculty. Addition of these future professionals to the System will greatly enhance the intellectual depth and breadth of the College and Campus community through seminar programs, discussion groups and campus lectures. The diverse scientific perspectives brought to the College, not just by the faculty but also by graduate students and postdoctoral fellows from a variety of backgrounds, will all contribute to the advancement of scholarship, which in turn will lead to an increase in the exposure of our programs to the scientific community and potential sources of funding. As the program develops, the University of Hawaii will be recognized as the center of excellence in pharmaceutical research and education for the Pacific Basin.

The benefits to our professional students cannot be overemphasized. A graduate program exposes students to career opportunities beyond the practice of pharmacy and creates new opportunities to enter into the pharmaceutical industry and academia. An active graduate program will give the professional student the opportunity to "try out" potential career options like drug discovery, pharmacetics, medicinal chemistry, pharmacology, or clinical research before committing to a particular career path. In this trial period, professional students will closely interact with graduate students and postdoctoral fellows who have already decided to pursue one of these fields, and they will receive the guidance and mentoring of a faculty member working at the forefront of their particular field. Students completing their PharmD program in the UH Hilo CoP will gain an understanding and appreciation of the breadth of opportunities through which pharmacists can contribute to modern healthcare.

This program will be unique in the Pacific Basin. Our location in Hilo will serve to make the program accessible to students from Hawaii, as well as those from other nations in the Pacific region, who are considered under-represented minorities in the scientific community. It is expected that the research and scholarly activities of this program will help to stimulate a local pharmaceutical/biotechnology industry in Hawaii, as similar programs have done in other locations around the country, thereby augmenting the job market for our students upon graduation while boosting the State's educational and economic future, and in so doing give unqualified support to President Greenwood's vision for the University of Hawaii's future.

CoP will graduate its first class in May 2011. Once this PhD program is initiated there will be significant interest from local, national and international students alike who will want to participate in it. Currently, 57 of our students have expressed interest in applying to join our program to pursue a PhD. With entry of this Fall's cohort, CoP will reach its full complement of 360 PharmD students, so it is expected that this number of students expressing interest will continue to grow. Once the program is started it is anticipated that we will have an initial cohort of between 5 and 10 entering students per year, leading to a total of 25-30 graduate students within 5 years.

8. Description of resources required

a. Faculty (existing and new FTEs)

The proposed PhD program will not require the hiring of any additional faculty at the Assistant, Associate or Full Professor level. To undertake this program, existing professorial CoP faculty will deliver both the didactic and research parts of the program. Currently, there are 19 CoP faculty either actively, or soon to be actively engaged in research, or affiliated with the College, who are in a position to offer Dissertation research topics to facilitate the delivery of this part of the program and also to offer the research short courses that will be required in the didactic part.
of the program. Based on a review of what seven other Colleges of Pharmacy around the country offer in terms of the didactic part of their PhD programs, it was found that typically a core of 25 didactic credit hours is required for graduation together with some elective credit hours (10-30) taken within the first three years of the program. Therefore, if each member of faculty offered just 3 credit hours within this three year period, a total of 57 credit hours could currently be offered. These credit hours would be a shift in emphasis for the faculty from doing their own research themselves to assisting PhD students with their research, and in so doing greatly potentiating their efforts. It is also envisioned that a number of basic graduate credit hours will be available to the program through the existing PharmD program.

b. Library resources (Including an evaluation of current resources and an estimate of the cost of additional resources required)

As all of the resources required by this PhD program are already available to our current Professional Students and CoP Faculty, there will be no need for extra Library resources.

c. Physical resources (space, equipment, etc.)

Within the College of Pharmacy, adequate facilities exist to enable all aspects of the PhD program to be undertaken. There are enough teaching and lecture rooms and resources within the new CoP buildings to enable all of the didactic part of the curriculum to be delivered. With the completion of the new CoP modular research laboratories, the research facilities in the USDA Forestry Complex (Nowelo Street) and those at the Waiakea Research Station, together with associated equipment, there is adequate space and resources to enable at least 25-30, individual PhD research projects to be undertaken at any one time.

d. Other resources required (staff, graduate assistantships, etc.)

It is likely that each year a number of graduate assistantships will be required. These assistants will be employed to assist with the day to day College functions at all levels, in particular with the teaching and research; they will be funded extramurally.

9. Five-Year Business Plan. Provide a five-year projected budget for the program that includes:

a. Annual costs to implement the program

See 9.4.

b. Projected enrollment and estimated tuition revenue

It is anticipated that the program will attract between 5-10 PhD students each year, up to around a total of 25-30 students at any one time. In the first few years of the program tuition of $5256 (Resident, 2010-2011), $12,096 (Non-resident, 2010-2011), $5782 (Resident, 2011-2012), and $13,306 (Non-resident, 2011-2012), will be levied per student per two semesters assuming 9 credits per semester multiplied by the number of students. Assuming six students enroll in year one this would mean tuition revenue of somewhere around $52,056 assuming a 50:50 split of Residents and Non-residents, and increasing by a similar amount for the following four years.

c. How will the program be funded?

In the short to medium term the program will be funded mainly through federal grants awarded to the CoP, and other grants obtained by individual researchers. These funds will enable all of the projected costs to be covered within the first 3-5 years of the program. It is anticipated that in the long term the program will be extramurally funded through grants to faculty from, for example, NIH, NSF, industrial partnerships and scholarships as well as through federal earmark funding (DOE), and through a certain number of students being self-funded.

d. Does the current or proposed budget (Department/College/Campus) include funds or a request for funds for the proposed program? Please provide details.

At the start of the new PhD program, the CoP will provide some teaching assistantships that are entirely consistent with the education mission of the College. Students will also be eligible for financial aid and UHH and other post graduate scholarships.

e. Given a “flat budget” situation, how will the proposed program be funded?

As noted above, no new funding will be requested for the establishment of this program. The program will be established with existing resources and new tuition revenue.

f. Mini Cost Revenue Template (Excel; top of next page)
10. Impact on current courses or programs.

The major impact the PhD program will have on current courses and programs will be to provide students with an advanced track to continue their studies here in Hawaii once they have completed their undergraduate or professional degrees. In other words, there may be greater retention of the most qualified students who would otherwise leave the Island to pursue postgraduate studies elsewhere. It is also envisioned that some of the courses offered in the PhD program may be open to students involved in other UH Hilo graduate programs (e.g., the M.S. in Tropical Conservation Biology and Environmental Science). In terms of PhD students attending courses offered in the PharmD program, this again should enhance these offerings as the mix of PharmD and PhD students should serve to elevate the academic value of such courses.

11. If this program is multidisciplinary, provide evidence of commitment for support from the colleges, departments, programs, and/or individuals expected to participate.

At this stage, even though the PhD in Pharmaceutical Sciences will be multidisciplinary by its very nature, implementation will be facilitated by faculty directly affiliated with the College of Pharmacy.
