SB 855 SD1 – RELATING TO COFFEE PEST CONTROL

Chair Luke, Vice Chair Cullen, and members of the House Committee on Finance:

Thank you for this opportunity to testify in strong support of SB 855 SD 1 relating to the coffee berry borer (CBB).

According to the 2018 State Agriculture overview published by the U.S. Department of Agriculture, Hawai'i produced 5.4 million pounds (green weight) of coffee grown on 7,100 harvested acres, with an average yield of 1.92 tons/acre, at a unit price of \$19.40/lb., for a value of \$50.16 million. These data show the high value of this crop to Hawai'i agriculture since that value is based on using just 0.65% of farm acres operated.

CBB is found in most coffee growing countries of the world and was discovered in Kona, Hawai'i in 2010. It has the potential to be a devastating disease for this industry. It is established on Hawai'i Island, and can be found now on other islands. CBB is endemic to Central Africa. It belongs to a subfamily of beetles that houses some of the most important pests world-wide. Female beetles bore into the berry and lay eggs inside the seed and the brood then feasts on the coffee seed. As this phase of the CBB life occurs inside the berry and seed, it can be difficult to control.

An integrated pest management program (IPM) developed Best Management Practices to control CBB. Collaborative research has shown that sanitation along with biocontrol can be effective. Cooperative Extension Agents with the College of Tropical Agriculture and Human Resources (CTAHR) at the University of Hawai'i at Mānoa (UHM) have estimated pre-pandemic that about 80% of coffee farmers are familiar with the IPM program. CTAHR Cooperative Extension Agents further estimate that the IPM program has directly saved more than \$11 million in farm gate value, and saved another \$11 million in efforts to control the spread of CBB. Realizing the direct and indirect effects highlights the value that this IPM program has for the coffee industry and the state of Hawai'i.

The IPM program uses an insecticide (pesticide), known as a mycoinsecticide, to control the borer. A fungus, *Beauveria bassiana*, is a biological control material and is

bought commercially. The Hawai'i Department of Agriculture (HDOA) was empowered in the past to develop and manage a CBB pesticide subsidy plan, allowing as much as \$600/acre for the grower. The basic approach of this bill is to maintain parts of that program into the future, until 2026.

The IPM program has been shown to be effective in the control of CBB. There is concern that without a full functioning subsidy program, efforts to apply IPM would be reduced; thereby reducing the on-farm and regional effectiveness of the strategy. A survey of coffee growers indicated that nearly 38% of growers would reduce the rate of the pesticide applied if the program was detrimentally affected. It is reasonable to assume that this would negatively affect the control and spread of CBB.

Given the estimated \$22 million/year effectiveness of the IPM program that includes a biological insecticide, we are in strong support of SB 855 SD 1 and will continue, through Cooperative Extension, to educate and train growers on the use of the IPM program. We thank the committee for the opportunity to submit testimony on this bill. We understand that in this time of budgetary challenges, we also defer to HDOA as to their priorities and budgetary requirements.
